

FEBRUARY 2024

Catastrophic Stop Update

The NDR Catastrophic Stop Sell model combines time-tested, objective indicators designed to identify high risk periods for the equity market. The model (chart right) weakened during the month but entered February with a fully invested equity allocation recommendation.

The bullish reading from the model is driven by strong internals. Five of the seven price-based measures—including relative strength, trend, and breadth—remain bullish. However, external measures are more mixed. While option-adjusted spreads and high-yield and emerging market breadth are bullish, the short-term trend in global trade—as measured by the Baltic Dry Index—became bearish during the month (chart left). Furthermore, investor sentiment remains excessively optimistic, which is bearish for stocks. For now, the weight-of-the-evidence recommends a fully invested allocation to equity sectors according to the model.

U.S. Market Update

The S&P 500 Total Return Index's end-of-year momentum carried into 2024, with a gain of about 1.7%. Breadth deteriorated with 6 of 11 S&P 500 sectors posting positive price gains for the month (chart below). Several of the "Magnificent Seven" (Apple, Microsoft, Alphabet, Amazon, Nvidia, Meta Platforms, and Tesla) continued their strong gains, which led to Communication Services and Information Technology being the top two best-performing sectors for the month. The stock market has historically rallied after the first rate cut. When there has

not been a recession, the rally has been stronger. At the January meeting, the Fed noted they want to see "greater confidence" that inflation is moving sustainably toward its 2% target. Powell indicated that March was not the Fed's base case for the first rate cut. We are still projecting a "soft landing" and the first cut to be closer to the May timeframe. With cyclical sectors like Financials, Information Technology, Industrials, and Communication Services tending to historically outperform during slow easing cycles, the improvement in the Financials

sector's performance may be anticipating this type of environment.

The sector model remained with a cyclical bias during the month, but there were some changes. Entering February, Financials and Communication Services improved and joined Information Technology and Energy at overweight. Consumer Discretionary and Health Care deteriorated and joined Materials, Industrials, Real Estate, Consumer Staples, and Utilities at underweight.

Information Technology's allocation rose sharply during the month and is now the largest overweight position. The S&P 500 Information Technology Index was the second-best performing sector in January (+ 3.9%) with Nvidia and Microsoft contributing the most to the sector's gains. On a fundamental basis, valuation improved to neutral and inflation expectations flashed a bullish signal (chart right). Technicals are confirming with one of the overbought/oversold indicators joining the other four internal (price-based) at a bullish reading during the month.

The Financials sector's allocation rose during the month, boosting it to an overweight position. On a fundamental basis, while the U.S. dollar and bank loan growth remain headwinds for the sector, economic surprises (chart left) and the 10-2 yield curve moved bullish during the month, joining business credit conditions and Financials' investment grade option-adjusted spreads. Additionally, the sector tends to outperform during slow easing cycles, gaining about 21% six months after the first cut, on average. Technicals are confirming with four of the six internal (price-based) indicators now bullish.

Consumer Discretionary's allocation dropped sharply, and the sector was downgraded from overweight to underweight. The positive monthly gain from Amazon (+2.1%) was more than offset by the significant drop by Tesla (-24.6%), which helped drive bearish signals from four of the six price-based indicators. On a fundamental basis, the improvement in long-term rates was offset by continued weakness in discretionary spending and earnings surprises (chart right).

The Industrials sector's allocation dropped and is now a significant underweight. On a fundamental basis, indicators remain mixed including valuation measures. While the U.S. dollar remains a tailwind, commodities and industrial production are neutral, and crude oil futures prices and consumer confidence are bearish. However, internals have deteriorated—five of six price-based

measures are bearish including two price momentum indicators (chart left) that flashed negative signals during the month.

Summary

The sector model remained with a cyclical bias during the month, but there were some changes. Entering February, Financials and Communication Services improved and joined Information Technology and Energy at overweight. Consumer Discretionary and Health Care deteriorated and joined Materials, Industrials, Real Estate, Consumer Staples, and Utilities at underweight. The sector model uses sector-specific indicators to determine opportunities and identify risks in an objective, weight-of-the-evidence approach.

Strategy description

- The Smart Sector® with Catastrophic Stop strategy combines two Ned Davis Research quantitative investment strategies: The NDR Sector Allocation and the NDR Catastrophic Stop.

The process is based on the weight of the evidence

- The fund begins by overweighting and underweighting the S&P 500 sectors based on Ned Davis Research's proprietary sector models.
- Each of the sector models utilize sector-specific, weight-of-the-evidence composites of fundamental, economic, technical, and behavioral indicators to determine each sector's probability of outperforming the S&P 500.
- Sectors are weighted accordingly relative to benchmark weightings.

When market risks become extraordinarily high — reduce your portfolio risk

- When risks are elevated, the NDR Catastrophic Stop Sell (CSS) model raises cash by up to 50% from the equity positions.
- The NDR CSS model combines time-tested, objective indicators designed to identify periods of high risk for the broad U.S. equity market. The model uses price-based, breadth, deviation from trend, fundamental, economic, interest rate, behavioral and volatility-based indicator composites.

When market risks return to normal — put your money back to work

- When risks are reduced, the strategy moves toward a fully allocated position, according to the NDR CSS model.

The Smart Sector® Strategy is not intended to be the primary basis for investment decisions and the usage of the model does not address the suitability of any particular investment for any particular investor.

Using any graph, chart, formula, model, or other device to assist in deciding which securities to trade or when to trade them presents many difficulties and their effectiveness has significant limitations, including that prior patterns may not repeat themselves continuously or on any particular occasion. In addition, market participants using such devices can impact the market in a way that changes the effectiveness of such devices. NDR believes no individual graph, chart, formula, model, or other device should be used as the sole basis for any investment decision and suggests that all market participants consider differing viewpoints and use a weight of the evidence approach that fits their investment needs.

DISCLOSURES

Past performance does not guarantee future results. No current or prospective client should assume future performance of any specific investment or strategy will be profitable or equal to past performance levels. All investment strategies have the potential for profit or loss. Changes in investment strategies, contributions or withdrawals and economic conditions may materially alter the performance of your portfolio. Different types of investments involve varying degrees of risk, and there can be no assurance that any specific investment or strategy will be suitable or profitable for a client's portfolio. Historical performance results for investment indexes and/or categories generally do not reflect the deduction of transaction and/or custodial charges or the deduction of an investment management fee, the incurrence of which would have the effect of decreasing historical performance results. There can be no assurances that a portfolio will match or outperform any particular benchmark.

NDR's strategies, including the model discussed in this publication, are intended to be used only by sophisticated investment professionals.

There may be a potential tax implication with a rebalancing strategy. Re-balancing involves selling some positions and buying others, and this activity results in realized gains and losses for the positions that are sold. The performance calculations do not reflect the impact that paying taxes would have, and for taxable accounts, any taxable gains would reduce the performance on an after-tax basis. This reduction could be material to the overall performance of an actual trading account. NDR does not provide legal, tax or accounting advice. Please consult your tax advisor in connection with this material, before implementing such a strategy, and prior to any withdrawals that you make from your portfolio.
